

Maximize and protect your technology investment.

Hosting services from Bell

Technology investments today need to excel in terms of security and performance. A highly secure and stable computing platform is most effective when it delivers optimum performance, speed and delivery. Managing data and physical security, as well as system and network performance requires a wide range of skill sets and resources. For many enterprises today, the right expertise and support can be found through hosting services.

Solution

Bell combines state-of-the-art data centres and industry-leading IP network resources to deliver a comprehensive range of hosting solutions to address your security and performance needs. Our new data centres are engineered to be highly secure, fault tolerant, and redundant. Similarly, the Bell core IP network is the largest, most robust of its kind in the country, supporting over 90 percent of credit and debit transactions nationally.

Features

Hosting services from Bell include four flexible offerings. All services are backed by uptime service level agreements (SLAs).

Colocation Hosting – We can house your IT equipment in our mission-critical data centres and provide power, cooling, space and connectivity. Our data centres feature fully-redundant power and HVAC systems, advanced fire detection and suppression, 24/7 monitoring, and on-site security and surveillance. Optional services include firewalls, load balancers, data backup and archival functions

Management – This service extends the features provided in Colocation Hosting to include operating system and application management for all leading software platforms (Exchange, IIS, Apache, SQL, and Citrix)

Virtual Data Centre – Our customer or Bell-managed virtual server solutions provide low-cost and highly-flexible computing capacity so you can enjoy “cloud” functionality without the risk. Unlike cloud-based offerings, our virtual services are delivered over Bell’s secure, private, SAS70-certified MPLS (multiprotocol label switching) network

Server Replication service – Offers real-time data replication and business continuity for your critical Microsoft IT systems

Business Continuity - Offers geographically redundant data centres with inter-site connectivity

The Bell logo, consisting of the word "Bell" in a bold, blue, sans-serif font.

Benefits

- Access to highly-sophisticated IT infrastructure solution at a fraction of the cost of an in-house data centre
- Leverage 24/7 IT monitoring and management
- Maximize your return on investment - buy only what you need and grow your environment as you need it
- Reduce up-front hardware and software costs
- Simplify software-license management

Why Bell?

Bell is a Canadian leader in converging information, communication and technologies (ICT) strategies to help enterprises improve business performance, speed time-to-market, and realize complete peace of mind. The foundation of our world-class ICT infrastructure is a high-powered reliable network backed by a multi-disciplinary team of experts. Our highly-skilled professionals offer diverse expertise in business process assessment, as well as solution design and deployment across a wide range of industries. Bell solutions and services can be customized to meet industry-specific needs and the business demands of today and the future.
