

Improve access and security for your Wi-Fi functions. Managed Guest Network Access service from Bell

Mobile connectivity to high speed Internet services is an essential amenity for today's enterprises. With the continuous expansion of ICT (information and communications technology) infrastructures, controlling access to documents and applications becomes both a source of productivity gains as well as an ever growing security priority. Finding ways to manage secure access is essential in ensuring the proper use of IT resources.

The solution

Bell draws upon the power and performance of the leading self-provisioning Wi-Fi service from DataValet™ to deliver an array of fully managed wireless services for improved guest access management and security. With Managed Guest Network Access service, you get the convenience of seamless, fully secure on-the-go guest network access via a standard Web interface.

Bell can be your single point of contact for all of your access needs, from application hosting to service and support. All services are backed by 24/7 assistance, maintenance and access to key management reports.

Managed Guest Network Access service is made up of six components:

1. A hosted service management platform of core applications and interfaces to centralize service/account management, billing, content management and guest user access.
2. A central network architecture that provides the highest levels of security and redundancy.
3. A local access controller that segregates network traffic from visitor traffic to provide a secure visitor option.

4. A self-provisioning interface that removes the burden of guest access password administration.
5. Professional services to support the deployment and maintenance of broadband services, including site surveys, installation, project management, training, integration and marketing assistance.
6. Access to a service management portal that can be modified to reflect the behaviour/business hours of the visitor network availability, as well as be used to retrieve usage reports.

You can also choose from a number of optional Web-based applications services:

- Web print and Web fax
- Multi-threat filter tools (virus, spam and content control)
- Bandwidth management and aggregation
- Private network connectivity

Benefits

- Centralize wireless security functions
- Simplify administration and control of remote user access
- Customize enhanced connectivity solutions
- Increase user productivity
- Reduce system maintenance, management and operational costs

Why Bell?

Bell is a Canadian leader in converging information, communication and technology (ICT) strategies to help enterprises improve business performance, speed time-to-market, and realize peace of mind. The foundation of our world-class ICT infrastructure is a high-powered reliable network backed by a multi-disciplinary team of experts. Our highly-skilled professionals offer diverse expertise in business process assessment, as well as solution design and deployment across a wide range of industries. Bell solutions and services can be customized to meet industry-specific needs and the business demands of today and the future.
